# DETERMINATION OF THE PRIME BOUND OF A GRAPH 

ABDERRAHIM BOUSSAÏRI AND PIERRE ILLE

#### Abstract

Given a graph $G$, a subset $M$ of $V(G)$ is a module of $G$ if for each $v \in V(G) \backslash M, v$ is adjacent to all the elements of $M$ or adjacent to none of them. For instance, $V(G), \varnothing$ and $\{v\}(v \in V(G))$ are modules of $G$ called trivial. Given a graph $G, \omega_{M}(G)$ (respectively $\left.\alpha_{M}(G)\right)$ denotes the largest integer $m$ such that there is a module $M$ of $G$ which is a clique (respectively a stable) set in $G$ with $|M|=m$. A graph $G$ is prime if $|V(G)| \geq 4$ and if all its modules are trivial. The prime bound of $G$ is the smallest integer $p(G)$ such that there is a prime graph $H$ with $V(H) \supseteq V(G), H[V(G)]=G$ and $\mid V(H)$, $V(G) \mid=p(G)$. We establish the following. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$ and $\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)$ is not an integer, $p(G)=\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)\right\rceil$. Then, we prove that for every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2^{k}$ where $k \geq 1$, $p(G)=k$ or $k+1$. Moreover $p(G)=k+1$ if and only if $G$ or its complement admits exactly $2^{k}$ isolated vertices. Lastly, we show that $p(G)=1$ for every non prime graph $G$ such that $|V(G)| \geq 4$ and $\alpha_{M}(G)=\omega_{M}(G)=1$.

## 1. Introduction

A graph $G=(V(G), E(G))$ is constituted by a finite vertex set $V(G)$ and an edge set $E(G) \subseteq\binom{V(G)}{2}$. Given a set finite $S, K_{S}=\left(S,\binom{S}{2}\right)$ is the complete graph on $S$ whereas ( $S, \varnothing$ ) is the empty graph. Let $G$ be a graph. With each $W \subseteq V(G)$ associate the subgraph $G[W]=\left(W,\binom{W}{2} \cap E(G)\right)$ of $G$ induced by $W$. Given $W \subseteq V(G), G[V(G) \backslash W]$ is also denoted by $G-W$ and by $G-w$ if $W=\{w\}$. A graph $H$ is an extension of $G$ if $V(H) \supseteq V(G)$ and $H[V(G)]=G$. Given $p \geq 0$, a $p$-extension of $G$ is an extension $H$ of $G$ such that $|V(H) \backslash V(G)|=p$. The complement of $G$ is the graph $\bar{G}=\left(V(G),\binom{V(G)}{2} \backslash E(G)\right)$. A subset $W$ of $V(G)$ is a clique (respectively a stable set) in $G$ if $G[W]$ is complete (respectively empty). The largest cardinality of a clique (respectively a stable set) in $G$ is the clique number (respectively the stability number) of $G$, denoted by $\omega(G)$ (respectively $\alpha(G)$ ). Given $v \in V(G)$, the neighbourhood $N_{G}(v)$ of $v$ in $G$ is the family $\{w \in V(G):\{v, w\} \in E(G)\}$. We consider $N_{G}$ as the function

[^0]from $V(G)$ to $2^{V(G)}$ defined by $v \mapsto N_{G}(v)$ for each $v \in V(G)$. A vertex $v$ of $G$ is isolated if $N_{G}(v)=\varnothing$. The number of isolated vertices of $G$ is denoted by $\iota(G)$.

We use the following notation. Let $G$ be a graph. For $v \neq w \in V(G)$,

$$
(v, w)_{G}= \begin{cases}0, & \text { if }\{v, w\} \notin E(G) \\ 1, & \text { if }\{v, w\} \in E(G)\end{cases}
$$

Given $W \nsubseteq V(G), v \in V(G) \backslash W$ and $i \in\{0,1\},(v, W)_{G}=i$ means $(v, w)_{G}=i$ for every $w \in W$. Given $W, W^{\prime} \mp V(G)$, with $W \cap W^{\prime}=\varnothing$, and $i \in\{0,1\}$, $\left(W, W^{\prime}\right)_{G}=i$ means $\left(w, W^{\prime}\right)_{G}=i$ for every $w \in W$. Given $W \nsubseteq V(G)$ and $v \in V(G) \backslash W, v \longleftrightarrow{ }_{G} W$ means that there is $i \in\{0,1\}$ such that $(v, W)_{G}=i$. The negation is denoted by $v \not \leftrightarrow_{G} W$.

Given a graph $G$, a subset $M$ of $V(G)$ is a module of $G$ if for each $v \in V(G) \backslash M$, we have $v \longleftrightarrow{ }_{G} M$. For instance, $V(G), \varnothing$ and $\{v\}(v \in V(G))$ are modules of $G$ called trivial. Clearly, if $|V(G)| \leq 2$, then all the modules of $G$ are trivial. On the other hand, if $|V(G)|=3$, then $G$ admits a nontrivial module. A graph $G$ is then said to be prime if $|V(G)| \geq 4$ and if all its modules are trivial. For instance, given $n \geq 4$, the path $(\{1, \ldots, n\},\{\{p, q\}$ : $|p-q|=1\})$ is prime. Given a graph $G, G$ and $\bar{G}$ share the same modules. Thus $G$ is prime if and only if $\bar{G}$ is.

Given a set $S$ with $|S| \geq 2, K_{S}$ admits a prime $\left[\log _{2}(|S|+1)\right]$-extension (see Sumner [8, Theorem 2.45] or Lemma 3.2 below). This is extended to any graph in [3, Theorem 3.7] and [2, Theorem 3.2] as follows.

Theorem 1.1. A graph $G$, with $|V(G)| \geq 2$, admits a prime $\left\lceil\log _{2}(|V(G)|+\right.$ 1)]-extension.

We now introduce the notion of prime bound. Let $G$ be a graph. The prime bound of $G$ is the smallest integer $p(G)$ such that $G$ admits a prime $p(G)$-extension. Observe that $p(G)=p(\bar{G})$ for every graph $G$. By Theorem 1.1, $p(G) \leq\left\lceil\log _{2}(|V(G)|+1)\right\rceil$. By considering the clique number and the stability number, Brignall [3, Conjecture 3.8] conjectured the following.

Conjecture 1.2. For a graph $G$ with $|V(G)| \geq 2$,

$$
p(G) \leq\left\lceil\log _{2}(\max (\alpha(G), \omega(G))+1)\right\rceil .
$$

We answer the conjecture positively by refining the notions of clique number and of stability number as follows. Given a graph $G$, the modular clique number $\omega_{M}(G)$ of $G$ is the largest cardinality of a clique in $G$ which is also a module of $G$. The modular stability number of $G$ is $\alpha_{M}(G)=\omega_{M}(\bar{G})$. The following lower bound is simply obtained.

Lemma 1.3. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$,

$$
p(G) \geq\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)\right\rceil
$$

Theorem 3.2 of [2] is proved by induction on the number of vertices. Using the main arguments of this proof, we improve Theorem 1.1 as follows.

Theorem 1.4. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$,

$$
p(G) \leq\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)+1\right)\right\rceil .
$$

Theorem 1.4 is proved using an induction argument as well. A direct construction of a suitable extension is provided in [1, Theorem 2]. The following is an immediate consequence of Lemma 1.3 and Theorem 1.4.

Corollary 1.5. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$,
$\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)\right\rceil \leq p(G) \leq\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)+1\right)\right\rceil$.
Let $G$ be graph such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$. On the one hand, it follows from Corollary 1.5 that

$$
p(G)=\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)\right\rceil
$$

when

$$
\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \notin\left\{2^{k}: k \geq 1\right\} .
$$

On the other, if $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2^{k}$, where $k \geq 1$, then $p(G)=k$ or $k+1$. The next theorem allows us to determine this.
Theorem 1.6. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2^{k}$ where $k \geq 1$,

$$
p(G)=k+1 \text { if and only if } \iota(G)=2^{k} \text { or } \iota(\bar{G})=2^{k} \text {. }
$$

Lastly, we show that $p(G)=1$ for every non prime graph $G$ such that $|V(G)| \geq 4$ and $\alpha_{M}(G)=\omega_{M}(G)=1$ (see Proposition 5.2).

## 2. Preliminaries

Given a graph $G$, the family of the modules of $G$ is denoted by $\mathcal{M}(G)$. Furthermore set $\mathcal{M}_{\geq 2}(G)=\{M \in \mathcal{M}(G):|M| \geq 2\}$. We begin with the well known properties of the modules of a graph (for example, see [4, Theorem 3.2, Lemma 3.9]).
Proposition 2.1. Let $G$ be a graph.
(1) Given $W \subseteq V(G), \quad\{M \cap W: M \in \mathcal{M}(G)\} \subseteq \mathcal{M}(G[W])$.
(2) Given a module $M \in \mathcal{M}(G), \mathcal{M}(G[M])=\{N \in \mathcal{M}(G): N \subseteq M\}$.
(3) Given $M, N \in \mathcal{M}(G)$ with $M \cap N=\varnothing$, there is $i \in\{0,1\}$ such that $(M, N)_{G}=i$.
Given a graph $G$, a partition $P$ of $V(G)$ is a modular partition of $G$ if $P \subseteq \mathcal{M}(G)$. Let $P$ be such a partition. Given $M \neq N \in P$, there is $i \in\{0,1\}$ such that $(M, N)_{G}=i$ by (3) of Proposition 2.1. This justifies the following definition: The quotient of $G$ by $P$ is the graph $G / P$ defined on $V(G / P)=P$ by $(M, N)_{G / P}=(M, N)_{G}$ for $M \neq N \in P$. We use the following properties of the quotient (for example, see [4, Theorems 4.1-4.3, Lemma 4.1]).
Proposition 2.2. Given a graph $G$, consider a modular partition $P$ of $G$.
(1) Given $W \subseteq V(G)$, if $|W \cap X|=1$ for each $X \in P$, then $G[W]$ and $G / P$ are isomorphic.
(2) For every $M \in \mathcal{M}(G)$, $\{X \in P: M \cap X \neq \varnothing\} \in \mathcal{M}(G / P)$.
(3) For every $Q \in \mathcal{M}(G / P), \cup Q \in \mathcal{M}(G)$.

The following strengthening of the notion of module is introduced to present the modular decomposition theorem (see Theorem 2.4 below). Given a graph $G$, a module $M$ of $G$ is said to be strong provided that for every $N \in \mathcal{M}(G)$, if $M \cap N \neq \varnothing$, then $M \subseteq N$ or $N \subseteq M$. The family of the strong modules of $G$ is denoted by $\mathcal{S}(G)$. Furthermore set

$$
\mathcal{S}_{\geq 2}(G)=\{M \in \mathcal{S}(G):|M| \geq 2\} .
$$

We recall the following well known properties of the strong modules of a graph (for example, see [4, Theorem 3.3]).

Proposition 2.3. Let $G$ be a graph. For every $M \in \mathcal{M}(G)$,

$$
\mathcal{S}(G[M])=\{N \in \mathcal{S}(G): N \mp M\} \cup\{M\}
$$

With each graph $G$, we associate the family $\Pi(G)$ of the maximal proper and nonempty strong modules of $G$ under inclusion. For convenience set

$$
\Pi_{1}(G)=\{M \in \Pi(G):|M|=1\} \text { and } \Pi_{\geq 2}(G)=\{M \in \Pi(G):|M| \geq 2\}
$$

The modular decomposition theorem is stated as follows.
Theorem 2.4 (Gallai [5, 6]). For a graph $G$ with $|V(G)| \geq 2$, the family $\Pi(G)$ realizes a modular partition of $G$. Moreover, the corresponding quotient $G / \Pi(G)$ is complete, empty or prime.

Let $G$ be a graph with $|V(G)| \geq 2$. As a direct consequence of the definition of a strong module, we obtain that the family $\mathcal{S}(G) \backslash\{\varnothing\}$ endowed with inclusion is a tree called the modular decomposition tree [7] of $G$. Given $M \in \mathcal{S}_{\geq 2}(G)$, it follows from Proposition 2.3 that $\Pi(G[M]) \subseteq \mathcal{S}(G)$. Furthermore, given $W \subseteq V(G)$, the family $\{M \in \mathcal{S}(G): M \supseteq W\}$ endowed with inclusion is a total order. Its smallest element is denoted by $\widehat{W}$.

Let $G$ be a graph with $|V(G)| \geq 2$. Using Theorem 2.4, we label $\mathcal{S}_{\geq 2}(G)$ by the function $\lambda_{G}$ defined as follows. For each $M \in \mathcal{S}_{\geq 2}(G)$,

$$
\lambda_{G}(M)=\left\{\begin{array}{ll}
\bigcirc & \text { if } G[M] / \Pi(G[M]) \\
\text { is complete, } \\
\sqsubset & \text { if } G[M] / \Pi(G[M]) \\
\text { is empty } \\
\sqsubset & \text { if } G[M] / \Pi(G[M])
\end{array}\right. \text { is prime. }
$$

## 3. Some prime extensions

Lemma 3.1. Let $S$ and $S^{\prime}$ be disjoint and finite sets such that $|S| \geq 2$ and $\left|S^{\prime}\right|=\left\lceil\log _{2}(|S|+1)\right\rceil$. There exists a prime graph $G$ defined on $V(G)=S \cup S^{\prime}$ such that $S$ and $S^{\prime}$ are stable sets in $G$.

Proof. If $|S|=2$, then $\left|S^{\prime}\right|=2$ and we can choose a path on 4 vertices for G. Assume that $|S| \geq 3$. As $\left|S^{\prime}\right|=\left\lceil\log _{2}(|S|+1)\right\rceil, 2^{\left|S^{\prime}\right|-1} \leq|S|$ and hence $\left|S^{\prime}\right| \leq|S|$. Thus there exists a bijection $\psi_{S^{\prime}}$ from $S^{\prime}$ onto $S^{\prime \prime} \subseteq S$. Consider the injection $f_{S^{\prime \prime}}: S^{\prime \prime} \longrightarrow 2^{S^{\prime}} \backslash\{\varnothing\}$ defined by $s^{\prime \prime} \mapsto S^{\prime} \backslash\left\{\left(\psi_{S^{\prime}}\right)^{-1}\left(s^{\prime \prime}\right)\right\}$. Since
$\left|S^{\prime}\right|=\left\lceil\log _{2}(|S|+1)\right],|S|<2^{\left|S^{\prime}\right|}$ and there exists an injection $f_{S}$ from $S$ into $2^{S^{\prime}} \backslash\{\varnothing\}$ such that $\left(f_{S}\right)_{\mid S^{\prime \prime}}=f_{S^{\prime \prime}}$. Lastly, consider the graph $G$ defined on $V(G)=S \cup S^{\prime}$ such that $S$ and $S^{\prime}$ are stable sets in $G$ and $\left(N_{G}\right)_{\mid S}=f_{S}$. We prove that $G$ is prime. If $|S|=3$, then $\left|S^{\prime}\right|=2$ and $G$ is a path on 5 vertices which is prime. Assume that $|S| \geq 4$ and hence $\left|S^{\prime}\right| \geq 3$. Let $M \in \mathcal{M}_{\geq 2}(G)$.

First, if $M \subseteq S$, then we would have $f_{S}(u)=f_{S}(v)$ for any $u \neq v \in M$. Thus $M \cap S^{\prime} \neq \varnothing$.

Second, suppose that $M \subseteq S^{\prime}$. Recall that for each $s \in S$, either $M \cap$ $N_{G}(s)=\varnothing$ or $M \subseteq N_{G}(s)$. Given $u \in M$, consider the function $f: S \longrightarrow$ $2^{\left(S^{\prime} \backslash M\right) \cup\{u\}} \backslash\{\varnothing\}$ defined by

$$
f(s)= \begin{cases}N_{G}(s), & \text { if } M \cap N_{G}(s)=\varnothing \\ \left(N_{G}(s) \backslash M\right) \cup\{u\}, & \text { if } M \subseteq N_{G}(s)\end{cases}
$$

for every $s \in S$. Since $\left(N_{G}\right)_{\mid S}$ is injective, $f$ is also and we would obtain that $|S|<2^{\left|S^{\prime}\right|-1}$. It follows that $M \cap S \neq \varnothing$.

Third, suppose that $S^{\prime \prime} \backslash M \neq \varnothing$. We have $\left(S \cap M, S^{\prime} \backslash M\right)_{G}=\left(S^{\prime} \cap\right.$ $\left.M, S^{\prime} \backslash M\right)_{G}=0$. Given $s^{\prime} \in S^{\prime} \cap M, N_{G}\left(\psi_{S^{\prime}}\left(s^{\prime}\right)\right)=S^{\prime} \backslash\left\{s^{\prime}\right\}$. In particular $S^{\prime} \backslash M \subseteq N_{G}\left(\psi_{S^{\prime}}\left(s^{\prime}\right)\right)$ and hence $\psi_{S^{\prime}}\left(s^{\prime}\right) \in S \backslash M$. Furthermore $\left(\psi_{S^{\prime}}\left(s^{\prime}\right), S^{\prime} \cap\right.$ $M)_{G}=\left(\psi_{S^{\prime}}\left(s^{\prime}\right), S \cap M\right)_{G}=0$. Therefore $S^{\prime} \cap M=\left\{s^{\prime}\right\}$. Similarly, we prove that $\left|S^{\prime} \backslash M\right|=1$ which would imply that $\left|S^{\prime}\right|=2$. It follows that $S^{\prime} \subseteq M$.

Lastly, suppose that $S \backslash M \neq \varnothing$. For each $s \in S \backslash M \neq \varnothing$, we would have $\left(s, S^{\prime}\right)_{G}=(s, S \cap M)_{G}=0$ and hence $N_{G}(s)=\varnothing$. It follows that $S \subseteq M$ and $M=S \cup S^{\prime}$.

Lemma 3.2. Let $C$ and $S^{\prime}$ be disjoint and finite sets such that $|C| \geq 2$ and $\left|S^{\prime}\right|=\left\lceil\log _{2}(|C|+1)\right\rceil$. There exists a prime graph $G$ defined on $V(G)=C \cup S^{\prime}$ such that $C$ is a clique and $S^{\prime}$ is a stable set in $G$.

Proof. There exists a bijection $\psi_{S^{\prime}}$ from $S^{\prime}$ onto $S^{\prime \prime} \subseteq C$. Consider the injection $f_{S^{\prime \prime}}: S^{\prime \prime} \longrightarrow 2^{S^{\prime \prime}} \backslash\left\{S^{\prime}\right\}$ defined by $s^{\prime \prime} \mapsto\left\{\left(\psi_{S^{\prime}}\right)^{-1}\left(s^{\prime \prime}\right)\right\}$. Let $f_{C}$ be any injection from $C$ into $2^{S^{\prime}} \backslash\left\{S^{\prime}\right\}$ such that $\left(f_{C}\right)_{\mid S^{\prime \prime}}=f_{S^{\prime \prime}}$. Lastly, consider the graph $G$ defined on $V(G)=C \cup S^{\prime}$ such that $C$ is a clique in $G, S^{\prime}$ is a stable set in $G$ and $N_{G}(c) \cap S^{\prime}=f_{C}(c)$ for each $c \in C$. We prove that $G$ is prime. Let $M \in \mathcal{M}_{\geq 2}(G)$. As in the proof of Lemma 3.1, we have $M \cap C \neq \varnothing$ and $M \cap S^{\prime} \neq \varnothing$.

Now, suppose that $S^{\prime} \backslash M \neq \varnothing$. We have $\left(C \cap M, S^{\prime} \backslash M\right)_{G}=\left(S^{\prime} \cap\right.$ $\left.M, S^{\prime} \backslash M\right)_{G}=0$. Given $t^{\prime} \in S^{\prime} \backslash M, N_{G}\left(\psi_{S^{\prime}}\left(t^{\prime}\right)\right) \cap S^{\prime}=\left\{t^{\prime}\right\}$. Thus $\psi_{S^{\prime}}\left(t^{\prime}\right) \in$ $C \backslash M$. But $\left(\psi_{S^{\prime}}\left(t^{\prime}\right), S^{\prime} \cap M\right)_{G}=\left(\psi_{S^{\prime}}\left(t^{\prime}\right), C \cap M\right)_{G}=1$ which contradicts $N_{G}\left(\psi_{S^{\prime}}\left(t^{\prime}\right)\right) \cap S^{\prime}=\left\{t^{\prime}\right\}$. It follows that $S^{\prime} \subseteq M$.

Lastly, suppose that $C \backslash M \neq \varnothing$. For each $c \in C \backslash M \neq \varnothing$, we have $\left(c, S^{\prime}\right)_{G}=(c, C \cap M)_{G}=1$ and hence $N_{G}(c) \cap S^{\prime}=S^{\prime}$. It follows that $C \subseteq M$ and $M=C \cup S^{\prime}$.

The question of prime extensions of a prime graph is not detailed enough in [2]. For instance, the number of prime 1-extensions of a prime graph
given in [2] is not correct. Moreover, Corollary 3.4 below is used without a precise proof.

Lemma 3.3. Let $G$ be a prime graph. Given $a \notin V(G)$, there exist exactly

$$
2^{|V(G)|}-2|V(G)|-2
$$

distinct prime extensions of $G$ to $V(G) \cup\{a\}$.
Proof. Consider any graph $H$ defined on $V(H)=V(G) \cup\{a\}$ such that $H[V(G)]=G$. We prove that $H$ is not prime if and only if

$$
N_{H}(a) \in\{\varnothing, V(G)\} \cup\left\{N_{G}(v): v \in V(G)\right\} \cup\left\{N_{G}(v) \cup\{v\}: v \in V(G)\right\} .
$$

To begin, assume that $N_{H}(a) \in\{\varnothing, V(G)\} \cup\left\{N_{G}(v): v \in V(G)\right\} \cup\left\{N_{G}(v) \cup\right.$ $\{v\}: v \in V(G)\}$. If $N_{H}(a)=\varnothing$ or $V(G)$, then $V(G)$ is a nontrivial module of $H$. If there is $v \in V(G)$ such that $N_{H}(a) \backslash\{v\}=N_{G}(v)$, then $\{a, v\}$ is a nontrivial module of $H$.

Conversely, assume that $H$ admits a nontrivial module $M$. By Proposition 2.1.(1), $M \backslash\{a\} \in \mathcal{M}(G)$. As $G$ is prime, $M \backslash\{a\} \neq \varnothing$ and $M \mp V(H)$, either $|M \backslash\{a\}|=1$ or $M=V(G)$. In the second instance, $N_{H}(a)=\varnothing$ or $V(G)$. In the first, there is $v \in V(G)$ such that $M=\{a, v\}$. Thus $N_{H}(a)=N_{G}(v)$ or $N_{G}(v) \cup\{v\}$. To conclude, observe that
$\left|\{\varnothing, V(G)\} \cup\left\{N_{G}(v): v \in V(G)\right\} \cup\left\{N_{G}(v) \cup\{v\}: v \in V(G)\right\}\right|=2+2|V(G)|$
because $G$ is prime.
Corollary 3.4. Let $G$ be a prime graph. For any $a \neq b \notin V(G)$, there exists a prime extension $H$ of $G$ to $V(G) \cup\{a, b\}$ such that $(a, b)_{H}=0$.

Proof. Since $|V(G)| \geq 4,2^{|V(G)|}-2|V(G)|-2 \geq 2$. Consequently there is an extension $H$ of $G$ to $V(G) \cup\{a, b\}$ such that $(a, b)_{H}=0, N_{H}(a) \neq N_{H}(b)$ and
$N_{H}(a), N_{H}(b) \notin\{\varnothing, V(G)\} \cup\left\{N_{G}(v): v \in V(G)\right\} \cup\left\{N_{G}(v) \cup\{v\}: v \in V(G)\right\}$.
By the proof of Lemma 3.3, $H-a$ and $H-b$ are prime. We show that $H$ is prime also. Let $M \in \mathcal{M}_{\geq 2}(H)$. By Proposition 2.1.(1), $M \backslash\{a\} \in \mathcal{M}(H-a)$. As $H-a$ is prime and $M \backslash\{a\} \neq \varnothing$, either $|M \backslash\{a\}|=1$ or $M \backslash\{a\}=$ $V(H) \backslash\{a\}$. In the first, there is $v \in V(G) \cup\{b\}$ such that $M=\{a, v\}$. If $v=b$, then $N_{H}(a)=N_{H}(b)$. If $v \in V(G)$, then $\{a, v\}$ would be a nontrivial module of $H-b$. Consequently $M \backslash\{a\}=V(H) \backslash\{a\}$. Since $H-b$ is prime, $a \not \leftrightarrow_{H} V(G)$ and hence $a \in M$. Thus $M=V(H)$.

## 4. Proof of Theorem 1.4

Let $G$ be a graph with $|V(G)| \geq 2$. By [2, Theorem 3.2], there exists a prime extension $H$ of $G$ such that

$$
2 \leq|V(H) \backslash V(G)| \leq\left\lceil\log _{2}(|V(G)|+1)\right\rceil
$$

and $V(H) \backslash V(G)$ is a stable set in $H$. We can consider the smallest integer $q(G)$ such that $q(G) \geq 2$ and $G$ admits a prime $q(G)$-extension $H$ such that $V(H) \backslash V(G)$ is a stable set in $H$.

The results below, from Proposition 4.1 to Corollary 4.4, are suggested by the proof of [2, Theorem 3.2].

We introduce a basic construction. Consider a graph $G$ and a modular partition $P$ of $G$ such that $P \subseteq \mathcal{S}(G)$ and $P \cap \mathcal{S}_{\geq 2}(G) \neq \varnothing$. Let $X \in P \cap \mathcal{S}_{\geq 2}(G)$ such that

$$
q(G[X])=\max \left(\left\{q(G[Y]): Y \in P \cap \mathcal{S}_{\geq 2}(G)\right\}\right) .
$$

Consider a set $S$ such that $S \cap V(G)=\varnothing$ and $|S|=q(G[X])$. There exists a prime $q(G[X])$-extension $H_{X}$ of $G[X]$ to $X \cup S$ such that $S$ is a stable set in $H_{X}$. Since $X$ is not a module of $H_{X}$, there is $s_{X} \in S$ such that $s_{X} \leftrightarrow H_{X} X$. Furthermore, if there is $v \in S$ such that $(v, X)_{H_{X}}=0$, then $V\left(H_{X}\right) \backslash\{v\}$ would be a nontrivial module of $H_{X}$. Thus $\left\{v \in S: v \longleftrightarrow H_{X} X\right\}=\{v \in$ $\left.S:(v, X)_{H_{X}}=1\right\}$. As $S$ is a stable set in $H_{X},\left\{v \in S:(v, X)_{H_{X}}=1\right\}$ is a module of $H_{X}$. It follows that

$$
\left\{\begin{array}{l}
\left\{v \in S: v \longleftrightarrow_{H_{X}} X\right\}=\left\{v \in S:(v, X)_{H_{X}}=1\right\}, \\
\left|\left\{v \in S: v \longleftrightarrow H_{X} X\right\}\right| \leq 1, \\
s_{X} \in S \backslash\left\{v \in S: v \longleftrightarrow H_{X} X\right\} .
\end{array}\right.
$$

Now, for each $Y \in\left(P \cap \mathcal{S}_{\geq 2}(G)\right) \backslash\{X\}$, there is a prime $q(G[Y])$-extension $H_{Y}$ of $G[Y]$ to $Y \cup S_{Y}$ such that $\left\{v \in S: v \longleftrightarrow H_{X} X\right\} \subseteq S_{Y} \subseteq S$ and $S_{Y}$ is a stable set in $H_{Y}$. Consider the extension $H$ of $G$ and of $H_{X}$ to $V(G) \cup S$ satisfying

- for each $Y \in\left(P \cap \mathcal{S}_{\geq 2}(G)\right) \backslash\{X\}, H\left[Y \cup S_{Y}\right]=H_{Y}$;
- for each $v \in V(G)$ such that $\{v\} \in P,\left(v, S \backslash\left\{s_{X}\right\}\right)_{H}=0$ and $\left(v, s_{X}\right)_{H}=1$.

Proposition 4.1. Given a graph $G$, consider a modular partition $P$ of $G$ such that $P \subseteq \mathcal{S}(G)$ and $P \cap \mathcal{S}_{\geq 2}(G) \neq \varnothing$. If the corresponding extension $H$ is not prime, then all the nontrivial modules of $H$ are included in $\{v \in V(G)$ : $\{v\} \in P\}$.

Proof. Let $M$ be a nontrivial module of $H$. By Proposition 2.1.(1), $M \cap$ $(X \cup S) \in \mathcal{M}(H[X \cup S])$. Since $H[X \cup S]$ is prime, we have $M \supseteq X \cup S$, $|M \cap(X \cup S)|=1$ or $M \cap(X \cup S)=\varnothing$.

For a first contradiction, suppose that $M \supseteq X \cup S$. Given $v \in V(G)$, if $\{v\} \in P$, then $v \not \leftrightarrow_{H} S$ so that $v \in M$. Thus $\{v \in V(G):\{v\} \in P\} \subseteq M$. Let $Y \in P \cap \mathcal{S}_{\geq 2}(G)$. By Proposition 2.1.(1), $M \cap\left(Y \cup S_{Y}\right) \in \mathcal{M}\left(H\left[Y \cup S_{Y}\right]\right)$. Since $H\left[Y \cup S_{Y}\right]$ is prime and since $S_{Y} \subseteq M \cap\left(Y \cup S_{Y}\right), Y \subseteq M$. Therefore $\cup\left(P \cap \mathcal{S}_{\geq 2}(G)\right) \subseteq M$ and we would have $M=V(H)$.

For a second contradiction, suppose that $|M \cap(X \cup S)|=1$. Consider $v \in S \cup X$ such that $M \cap(X \cup S)=\{v\}$. Suppose that $v \in X$. We have $M \subseteq V(G)$ and $M \in \mathcal{M}(G)$ by Proposition 2.1.(1). As $X \in \mathcal{S}(G)$ and $v \in X \cap M, X \subseteq M$ or $M \subseteq X$. In both cases, we would have $|M \cap(X \cup S)| \geq 2$.

Suppose that $v \in S$. There is $Y \in P \backslash\{X\}$ such that $Y \cap M \neq \varnothing$. Let $y \in Y \cap M$. Since $y \longleftrightarrow_{G} X, v \longleftrightarrow H_{X} X$ and hence $v \neq s_{X}$. If $Y \in P \cap \mathcal{S}_{\geq 2}(G)$, then $v \in S_{Y}$ and $M \cap\left(Y \cup S_{Y}\right)$ would be a nontrivial module of $H\left[Y \cup S_{Y}\right]$. If $Y=\{y\}$, then $\left(y, s_{X}\right)_{H}=1$. Thus $\left(v, s_{X}\right)_{H}=1$ and $S$ would not be a stable set in $H$.

It follows that $M \cap(X \cup S)=\varnothing$. By Proposition 2.1.(1), $M \in \mathcal{M}(G)$. Suppose for a contradiction that there is $Y \in\left(P \cap \mathcal{S}_{\geq 2}(G)\right) \backslash\{X\}$ such that $Y \cap M \neq \varnothing$. As $Y \in \mathcal{S}(G), Y \subseteq M$ or $M \subseteq Y$. In both cases, $M \cap\left(Y \cup S_{Y}\right)$ would be a nontrivial module of $H\left[Y \cup S_{Y}\right]$. It follows that $Y \cap M=\varnothing$. Therefore $M \subseteq\{v \in V(G):\{v\} \in P\}$.

Corollary 4.2. Given a graph $G$ such that $G / \Pi(G)$ is prime, we have

$$
q(G) \leq\left\{\begin{array}{l}
2, \text { if } \Pi_{\geq 2}(G)=\varnothing, \\
\max \left(\left\{q(G[X]): X \in \Pi_{\geq 2}(G)\right\}\right), \text { if } \quad \Pi_{\geq 2}(G) \neq \varnothing
\end{array}\right.
$$

Proof. If $G$ is prime, then $q(G)=2$ by Corollary 3.4. Assume that $G$ is not prime, that is, $\Pi_{\geq 2}(G) \neq \varnothing$. Let $H$ be the extension of $G$ associated with $\Pi(G)$. Suppose that $H$ admits a nontrivial module $M$. By Proposition 4.1, $\{\{u\}: u \in M\} \subseteq \Pi_{1}(G)$. Thus $M \in \mathcal{M}(G)$ by Proposition 2.1.(1). By Proposition 2.2.(2), $\{\{u\}: u \in M\}$ would be a nontrivial module of $G / \Pi(G)$.

Proposition 4.3. Given a graph $G$ such that $G / \Pi(G)$ is complete or empty, we have

$$
q(G) \leq \max \left(2,\left\lceil\log _{2}\left(\left|\Pi_{1}(G)\right|+1\right)\right\rceil\right),
$$

or

$$
q(G) \leq \max \left(\left\{q(G[X]): X \in \Pi_{\geq 2}(G)\right\}\right) .
$$

Proof. Assume that $G / \Pi(G)$ is empty. If $\Pi(G)=\Pi_{1}(G)$, then $G$ is empty by Proposition 2.2.(1), and it suffices to apply Lemma 3.1. Assume that $\Pi_{\geq 2}(G) \neq \varnothing$ and set

$$
W_{2}=\bigcup \Pi_{\geq 2}(G) .
$$

Let $H$ be the extension of $G$ associated with $\Pi(G)$. Recall that $V(H)=$ $V(G) \cup S, V(G) \cap S=\varnothing$ and $|S|=q(G[X])$ where $X \in \Pi_{\geq 2}(G)$ such that $q(G[X])=\max \left(\left\{q(G[Y]): Y \in \Pi_{\geq 2}(G)\right\}\right)$. Moreover $H[X \cup S]$ is prime.

If $\left|\Pi_{1}(G)\right| \leq 1$, then $H$ is prime by Proposition 4.1 so that $q(G) \leq \max$ $\left(\left\{q(G[Y]): Y \in \Pi_{\geq 2}(G)\right\}\right)$. Assume that $\left|\Pi_{1}(G)\right| \geq 2$ and set

$$
W_{1}=V(G) \backslash W_{2}
$$

By Lemma 3.1, there exists a prime extension $H_{1}$ of $G\left[W_{1}\right]$ to $W_{1} \cup S_{1}$ such that $\left|S_{1}\right|=\left\lceil\log _{2}\left(\left|W_{1}\right|+1\right)\right\rceil$ and $S_{1}$ is stable in $H_{1}$. As $G / \Pi(G)$ is empty, $\Pi_{\geq 2}(G) \in \mathcal{M}(G / \Pi(G))$. By Proposition 2.2.(3), $W_{2} \in \mathcal{M}(G)$. Thus $\Pi_{\geq 2}(G) \subseteq \mathcal{S}\left(G\left[W_{2}\right]\right)$ by Proposition 2.3. It follows from Proposition 4.1 that $H\left[W_{2} \cup S\right]$ is prime. We construct suitable extensions of $G$ according to whether $\left|S_{1}\right| \leq|S|$ or not.

To begin, suppose $\left|S_{1}\right| \leq|S|$. We can assume that

$$
\left\{v \in S: v \longleftrightarrow_{H[X \cup S]} X\right\} \subseteq S_{1} \subseteq S
$$

and consider an extension $H^{\prime}$ of $H_{1}$ and $H\left[W_{2} \cup S\right]$ to $V(G) \cup S$. We show that $H^{\prime}$ is prime. Let $M \in \mathcal{M}_{\geq 2}\left(H^{\prime}\right)$. By Proposition 2.1.(1), $M \cap\left(W_{2} \cup S\right) \in$ $\mathcal{M}\left(H\left[W_{2} \cup S\right]\right)$. Since $H\left[W_{2} \cup S\right]$ is prime, $M \cap\left(W_{2} \cup S\right)=\varnothing,\left|M \cap\left(W_{2} \cup S\right)\right|=1$ or $M \supseteq\left(W_{2} \cup S\right)$.

- Suppose for a contradiction that $M \cap\left(W_{2} \cup S\right)=\varnothing$. By Proposition 2.1.(1), $M$ would be a nontrivial module of $H_{1}$.
- Suppose for a contradiction that $\left|M \cap\left(W_{2} \cup S\right)\right|=1$ and consider $w \in W_{2} \cup S$ such that $M \cap\left(W_{2} \cup S\right)=\{w\}$. First, suppose that $w \in W_{2}$ and consider $Y \in \Pi_{\geq 2}(G)$ such that $w \in Y$. By Proposition 2.1.(1), $M \in \mathcal{M}(G)$. As $Y \in \mathcal{S}(G)$ and $w \in X \cap M, X \subseteq M$ or $M \subseteq X$. In both cases, we would have $\left|M \cap\left(W_{2} \cup S\right)\right| \geq 2$. Second, suppose that $w \in S$ and consider $v \in W_{1} \cap M$. Since $v \longleftrightarrow_{G} X, w \longleftrightarrow_{H\left[W_{2} \cup S\right]} X$ and hence $w \in S_{1}$. It follows from Proposition 2.1.(1) that $M$ would be a nontrivial module of $H_{1}$.
Consequently $M \supseteq\left(W_{2} \cup S\right)$. By Proposition 2.1.(1), $M \cap\left(W_{1} \cup S_{1}\right) \in \mathcal{M}\left(H_{1}\right)$. As $H_{1}$ is prime and $M \cap\left(W_{1} \cup S_{1}\right) \supseteq S_{1}, M \cap\left(W_{1} \cup S_{1}\right)=\left(W_{1} \cup S_{1}\right)$ so that $M=V\left(H^{\prime}\right)$.

Now, assume that $\left|S_{1}\right|>|S|$. We can assume that $S \mp S_{1}$ and we consider the unique extension $H^{\prime \prime}$ of $H_{1}$ and $H\left[W_{2} \cup S\right]$ to $V(G) \cup S_{1}$ such that

$$
\begin{equation*}
\left(W_{2}, S_{1} \backslash S\right)_{H^{\prime \prime}}=0 . \tag{4.1}
\end{equation*}
$$

We show that $H^{\prime \prime}$ is prime. Let $M \in \mathcal{M}_{\geq 2}\left(H^{\prime \prime}\right)$. We obtain $M \cap\left(W_{1} \cup S_{1}\right)=\varnothing$, $\left|M \cap\left(W_{1} \cup S_{1}\right)\right|=1$ or $M \supseteq\left(W_{1} \cup S_{1}\right)$. If $M \cap\left(W_{1} \cup S_{1}\right)=\varnothing$, then $M$ would be a nontrivial module of $H\left[W_{2} \cup S\right]$.

Suppose for a contradiction that $\left|M \cap\left(W_{1} \cup S\right)_{1}\right|=1$ and consider $w \epsilon$ $W_{1} \cup S_{1}$ such that $M \cap\left(W_{1} \cup S_{1}\right)=\{w\}$. There is $v \in W_{2} \cap M$. Let $Y \in \Pi_{\geq 2}(G)$ such that $v \in Y$.

- Suppose that $w \in W_{1}$. By Proposition 2.1.(1), $M \in \mathcal{M}(G)$. Since $Y \in \mathcal{S}(G)$ and since $Y \cap M \neq \varnothing$ and $w \in M \backslash Y, Y \subseteq M$. It follows from Proposition 2.1.(1) that $M \cap\left(W_{2} \cup S\right)$ would be a nontrivial module of $H\left[W_{2} \cup S\right]$.
- Suppose that $w \in S_{1}$. By Proposition 2.1.(1), $M \cap\left(W_{2} \cup S\right) \in$ $\mathcal{M}\left(H\left[W_{2} \cup S\right]\right)$. As $H\left[W_{2} \cup S\right]$ is prime, $v \in M \cap W_{2}$ and $M \cap S \subseteq\{w\}$, $M \cap\left(W_{2} \cup S\right)=\{v\}$ hence $w \in S_{1} \backslash S$. For every $u \in W_{2} \backslash\{v\}$, we have $(u, v)_{G}=(u, w)_{H^{\prime \prime}}=0$ by (4.1). Since $\left(v, W_{1}\right)_{G}=0$, we would have $N_{G}(v)=\varnothing$ and hence $\{v\} \in \Pi_{1}(G)$.
It follows that $M \supseteq\left(W_{1} \cup S_{1}\right)$. By Proposition 2.1.(1), $M \cap\left(W_{2} \cup S\right) \in$ $\mathcal{M}\left(H\left[W_{2} \cup S\right]\right)$. As $H\left[W_{2} \cup S\right]$ is prime and $M \cap\left(W_{2} \cup S\right) \supseteq S, M \cap\left(W_{2} \cup S\right)=$ $\left(W_{2} \cup S\right)$ so that $M=V\left(H^{\prime \prime}\right)$.

Finally, observe that when $G / \Pi(G)$ is complete, we can proceed as previously by replacing (4.1) by $\left(W_{2}, S_{1} \backslash S\right)_{H^{\prime \prime}}=1$.

The next result follows from Corollary 4.2 and Proposition 4.3 by induction on the number of vertices.

Corollary 4.4. Given a graph $G$ with $|V(G)| \geq 2$,

- $q(G)=2$ if for every $X \in \mathcal{S}_{\geq 2}(G)$ such that $\lambda_{G}(X) \in\{\bigcirc, \bigcirc\}$, we have $\left|\Pi_{1}(G[X])\right| \leq 1 ;$
- $q(G) \leq \max \left(\left\{\left\lceil\log _{2}\left(\left|\Pi_{1}(G[Y])\right|+1\right)\right\rceil: Y \in \mathcal{S}_{\geq 2}(G), \lambda_{G}(Y) \in\{\bigcirc, \bigcirc\}\right\}\right)$ if there is $X \in \mathcal{S}_{\geq 2}(G)$ such that $\lambda_{G}(X) \in\{\bigcirc, \bigcirc\}$ and $\left|\Pi_{1}(G[X])\right| \geq 2$.

Given the second assertion of Corollary 4.4, Theorem 1.4 follows from the next transcription in terms of the modular decomposition tree. Let $G$ be a graph. Denote by $\mathbb{M}(G)$ the family of the maximal elements of $\mathcal{M}_{\geq 2}(G)$ under inclusion which are cliques or stable sets in $G$.

Proposition 4.5. Let $G$ be a graph. Given $M \subseteq V(G)$, we have $M \in \mathbb{M}(G)$ if and only if $M \in \mathcal{M}_{\geq 2}(G), \lambda_{G}(\widehat{M}) \in\{\bigcirc, \bigcirc\}$ and $M=\{v \in \widehat{M}:\{v\} \in$ $\Pi(G[\widehat{M}])\}$.

Proof. To begin, consider $M \in \mathbb{M}(G)$ and assume that $M$ is a stable set in $G$. By Proposition 2.1.(1), $M \in \mathcal{M}(G[\widehat{M}])$. Set

$$
Q=\{X \in \Pi(G[\widehat{M}]): X \cap M \neq \varnothing\} .
$$

By definition of $\widehat{M},|Q| \geq 2$ and hence $M=\cup Q$ because $Q \subseteq \mathcal{S}(G[\widehat{M}])$. Furthermore, $Q \subseteq \mathcal{S}(G[M])$ by Proposition 2.3. As all the strong modules of an empty graph are trivial, we obtain $|X|=1$ for each $X \in Q$, that is,

$$
M \subseteq\{v \in \widehat{M}:\{v\} \in \Pi(G[\widehat{M}])\}
$$

By Proposition 2.2.(2), $Q \in \mathcal{M}(G[\widehat{M}] / \Pi(G[\widehat{M}]))$. For a contradiction, suppose that $\lambda_{G}(\widehat{M})=\sqsubset$. Since $Q \in \mathcal{M}_{\geq 2}(G[\widehat{M}] / \Pi(G[\widehat{M}])), Q=\Pi(G[\widehat{M}])$ and hence $M=\widehat{M}$. As $|X|=1$ for each $X \in Q, G[\widehat{M}] / \Pi(G[\widehat{M}])$ and $G[\widehat{M}]$ are isomorphic by Proposition 2.2.(1). It would follow that $G[M]$ is prime. Consequently $\lambda_{G}(\widehat{M}) \in\{\bigcirc, \bigcirc\}$. Given $v \neq w \in M$, we have $(\{v\},\{w\})_{G[\widehat{M}] / \Pi(G[\widehat{M}])}=(v, w)_{G}=0$. Thus

$$
\lambda_{G}(\widehat{M})=\bigcirc
$$

Since $\lambda_{G}(\widehat{M})=\bigcirc$, we have $\Pi_{1}(G[\widehat{M}]) \in \mathcal{M}(G[\widehat{M}] / \Pi(G[\widehat{M}]))$. By Proposition 2.2.(3), $\cup \Pi_{1}(G[\widehat{M}]) \in \mathcal{M}(G[\widehat{M}])$ and hence $\cup \Pi_{1}(G[\widehat{M}]) \in \mathcal{M}(G)$ by Proposition 2.1.(2). Given $v \neq w \in \bigcup \Pi_{1}(G[\widehat{M}])$, we have

$$
(v, w)_{G}=(\{v\},\{w\})_{G[\widehat{M}] / \Pi(G[\widehat{M}])}=0
$$

Therefore $\cup \Pi_{1}(G[\widehat{M}])$ is a stable set of $G$. As $M \subseteq \cup \Pi_{1}(G[\widehat{M}]), M=$ $\cup \Pi_{1}(G[\widehat{M}])$ by maximality of $M$. It follows that

$$
M=\{v \in \widehat{M}:\{v\} \in \Pi(G[\widehat{M}])\}
$$

Conversely, consider $M \in \mathcal{M}_{\geq 2}(G)$ such that $\lambda_{G}(\widehat{M})=\bigcirc$ and $M=\{v \in$ $\widehat{M}:\{v\} \in \Pi(G[\widehat{M}])\}$. As $\lambda_{G}(\widehat{M})=\bigcirc, \Pi_{1}(G[\widehat{M}]) \in \mathcal{M}(G[\widehat{M}] / \Pi(G[\widehat{M}]))$.

By Proposition 2.2.(3), $M=\cup \Pi_{1}(G[\widehat{M}]) \in \mathcal{M}(G[\widehat{M}])$ and hence $M \in$ $\mathcal{M}(G)$ by Proposition 2.1.(2). Since $(v, w)_{G}=(\{v\},\{w\})_{G[\widehat{M}] / \Pi(G[\widehat{M}])}=0$ for all $v \neq w \in M, M$ is a stable set in $G$. There is $N \in \mathbb{M}(G)$ such that $N \supseteq M$. As $M$ is a stable set in $G, N$ is as well. By what precedes, $N=$ $\{v \in \widehat{N}:\{v\} \in \Pi(G[\widehat{N}])\}$. We have $\widehat{M} \subseteq \widehat{N}$ because $M \subseteq N$. Furthermore $\widehat{M} \in \mathcal{S}(G[\widehat{N}])$ by Proposition 2.3. Given $v \in M$, we obtain $\{v\} \mp \widehat{M} \subseteq \widehat{N}$. Since $\{v\} \in \Pi(G[\widehat{N}]), \widehat{M}=\widehat{N}$. Therefore $M=N$ because $M=\{v \in \widehat{M}$ : $\{v\} \in \Pi(G[\widehat{M}])\}$ and $N=\{v \in \widehat{N}:\{v\} \in \Pi(G[\widehat{N}])\}$.

Let $G$ be a graph such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$. Consider $M \in$ $\mathbb{M}(G)$. By Proposition 4.5, $\lambda_{G}(\widehat{M}) \in\{\bigcirc, \bullet\}$ and $\left|\Pi_{1}(G[\widehat{M}])\right|=|M| \geq 2$. By Corollary 4.4,
$\left.p(G) \leq q(G) \leq \max \left(\left\{\mid \log _{2}\left(\left|\Pi_{1}(G[Y])\right|+1\right)\right]: Y \in \mathcal{S}_{\geq 2}(G), \lambda_{G}(Y) \in\{\bigcirc, \bullet\}\right\}\right)$.
By Proposition 4.5,

$$
\max \left(\left\{\left\lceil\log _{2}\left(\left|\Pi_{1}(G[Y])\right|+1\right)\right\rceil: Y \in \mathcal{S}_{\geq 2}(G), \lambda_{G}(Y) \in\{\bigcirc, \bullet\}\right\}\right)
$$

equals

$$
\max \left(\left\{\left\lceil\log _{2}(|M|+1)\right\rceil: M \in \mathbb{M}(G)\right\}\right)
$$

Clearly

$$
\max \left(\left\{\left\lceil\log _{2}(|M|+1)\right\rceil: M \in \mathbb{M}(G)\right\}\right)=\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)+1\right)\right\rceil
$$

and consequently we recover Theorem 1.4,

$$
p(G) \leq\left\lceil\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)+1\right)\right\rceil .
$$

To obtain Corollary 1.5, we prove Lemma 1.3.
Proof of Lemma 1.3. Let $G$ be a graph such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$. There exists $S \in \mathcal{M}(G)$ such that $|S|=\max \left(\alpha_{M}(G), \omega_{M}(G)\right)$ and $S$ is a clique or a stable set in $G$. Given an integer $p<\log _{2}\left(\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right)$, consider any $p$-extension $H$ of $G$. We must prove that $H$ is not prime. We have $2^{|V(H) \backslash V(G)|}<|S|$ so that the function $S \longrightarrow 2^{V(H) \backslash V(G)}$, defined by $s \mapsto N_{H}(s) \cap(V(H) \backslash V(G))$ is not injective. There are $s \neq t \in S$ such that $v \longleftrightarrow H_{H}\{s, t\}$ for every $v \in V(H) \backslash V(G)$. As $S$ is a module of $G$, we have $v \longleftrightarrow_{H}\{s, t\}$ for every $v \in V(G) \backslash S$. Since $S$ is a clique or a stable set in $G,\{s, t\}$ is a nontrival module of $H$.

When a graph or its complement admits isolated vertices, we obtain the following.

Lemma 4.6. Given a graph $G$, if $\iota(G) \neq 0$ or $\iota(\bar{G}) \neq 0$, then

$$
p(G) \geq\left\lceil\log _{2}(\max (\iota(G), \iota(\bar{G}))+1)\right\rceil .
$$

Proof. By interchanging $G$ and $\bar{G}$, assume that $\iota(G) \geq \iota(\bar{G})$. Given $p<$ $\left\lceil\log _{2}(\iota(G)+1)\right]$, consider any $p$-extension $H$ of $G$. We have $2^{|V(H) \backslash V(G)|} \leq$ $\iota(G)$ and we verify that $H$ is not prime.

For each $x \in V(G)$ such that $N_{G}(x)=\varnothing$, we have $N_{H}(x) \subseteq V(H) \backslash V(G)$. Thus $\left(N_{H}\right)_{\left\{\left\{v \in V(G): N_{G}(v)=\varnothing\right\}\right.}$ is a function from $\left\{v \in V(G): N_{G}(v)=\varnothing\right\}$ to $2^{V(H) \backslash V(G)}$. As observed in the proof of Lemma 3.1, if $\left(N_{H}\right)_{\left\{\left\{v \in V(G): N_{G}(v)=\varnothing\right\}\right.}$ is not injective, then $\{x, y\}$ is a nontrivial module of $H$ when $x \neq y \in\{v \in$ $\left.V(G): N_{G}(v)=\varnothing\right\}$ with $N_{H}(x)=N_{H}(y)$. So assume that

$$
\left(N_{H}\right)_{\mid\left\{v \in V(G): N_{G}(v)=\varnothing\right\}} \text { is injective. }
$$

As $2^{|V(H) \backslash V(G)|} \leq \iota(G)$, we obtain that $\left(N_{H}\right)_{\mid\left\{v \in V(G): N_{G}(v)=\varnothing\right\}}$ is bijective. Thus there is $x \in\left\{v \in V(G): N_{G}(v)=\varnothing\right\}$ such that $N_{H}(x)=\varnothing$. Therefore $V(H) \backslash\{x\}$ is a nontrivial module of $H$ and $H$ is not prime.

The next result is a simple consequence of Proposition 4.5 which is useful in proving Theorem 1.6.

Corollary 4.7. Given a graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right) \geq 2$, the elements of $\mathbb{M}(G)$ are pairwise disjoint.

Proof. Consider $M, N \in \mathbb{M}(G)$ such that $M \cap N \neq \varnothing$. Let $v \in M \cap N$. Since $\widehat{M}, \widehat{N} \in \mathcal{S}(G)$ and $v \in \widehat{M} \cap \widehat{N}, \widehat{M} \subseteq \widehat{N}$ or $\widehat{N} \subseteq \widehat{M}$. For instance, assume that $\widehat{M} \subseteq \widehat{N}$. By Proposition $2.3, \widehat{M} \in \mathcal{S}(G[\widehat{N}])$. Furthermore $\{v\} \in \Pi(G[\widehat{N}])$ by Proposition 4.5. As $\{v\} \mp \widehat{M} \subseteq \widehat{N}$, we obtain $\widehat{M}=\widehat{N}$. Lastly, $M=\{w \in \widehat{M}:\{w\} \in \Pi(G[\widehat{M}])\}$ and $N=\{w \in \widehat{N}:\{w\} \in \Pi(G[\widehat{N}])\}$ by Proposition 4.5. Thus $M=N$.

## 5. Proof of Theorem 1.6

Given a graph $G$, denote by $\mathbb{P}(G)$ the family of $M \in \mathcal{M}(G)$ such that $G[M]$ is prime. For every $M \in \mathbb{P}(G), M \in \mathcal{S}(G)$ because $G[M]$ is prime. It follows that the elements of $\mathbb{P}(G)$ are pairwise disjoint. Thus the elements of $\mathbb{M}(G) \cup \mathbb{P}(G)$ are also by Corollary 4.7. Set

$$
I(G)=V(G) \backslash((\bigcup \mathbb{M}(G)) \cup(\bigcup \mathbb{P}(G)))
$$

We prove Theorem 1.6 when $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2$.
Proposition 5.1. For every graph $G$ such that $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2$,

$$
p(G)=2 \text { if and only if } \iota(G)=2 \text { or } \iota(\bar{G})=2 \text {. }
$$

Proof. It follows from Lemma 1.3 and Theorem 1.4 that $p(G)=1$ or 2. To begin, assume that $\iota(G)=2$ or $\iota(\bar{G})=2$. By Lemma 4.6, $p(G) \geq 2$ and hence $p(G)=2$. Conversely, assume that $p(G)=2$. Let $a \notin V(G)$. As $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2,|N|=2$ for each $N \in \mathbb{M}(G)$. Let $N_{0} \in \mathbb{M}(G)$. For $N \in \mathbb{P}(G), G[N]$ is prime. By Lemma 3.3, $G[N]$ admits a prime extension $H_{N}$ defined on $N \cup\{a\}$. We consider any 1-extension $H$ of $G$ to $V(G) \cup\{a\}$ satisfying the following.
(1) For each $N \in \mathbb{M}(G), a \not \leftrightarrow_{H} N$.
(2) For each $N \in \mathbb{P}(G), H[N \cup\{a\}]=H_{N}$.
(3) Let $v \in I(G)$. There is $i \in\{0,1\}$ such that $\left(v, N_{0}\right)_{G}=i$. We require that $(v, a)_{H} \neq i$.
To begin, we prove that $\mathcal{S}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$. Given $M \in \mathcal{S}_{\geq 2}(G)$, we have to verify that $a \longleftrightarrow_{H} M$. Let $N$ be a minimal element under inclusion of $\left\{N^{\prime} \in \mathcal{S}_{\geq 2}(G): N^{\prime} \subseteq M\right\}$. By Proposition 2.3, $\Pi(G[N]) \subseteq \mathcal{S}(G)$. By minimality of $N, \Pi(G[N])=\Pi_{1}(G[N])$ so that $G[N]$ and $G[N] / \Pi(G[N])$ are isomorphic by Proposition 2.2.(1). We distinguish the following two cases.

- Assume that $\lambda_{G}(N)=\sqsubset$. We obtain that $G[N]$ is prime, that is, $N \in \mathbb{P}(G)$. As $H[N \cup\{a\}]$ is prime, $a \not \leftrightarrow_{H} N$.
- Assume that $\lambda_{G}(N) \in\{\bigcirc, \bigcirc\}$. By Proposition $4.5, N \in \mathbb{M}(G)$. Thus $|N|=2$ and $a \longleftrightarrow_{H} N$ by definition of $H$.
In both cases, $a \not \longleftrightarrow_{H} N$ and hence $a \not \longleftrightarrow_{H} M$.
Now we prove that $\mathcal{M}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$. Let $M \in \mathcal{M}_{\geq 2}(G)$. Since $\mathcal{S}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$, assume that $M \notin \mathcal{S}_{\geq 2}(G)$. Set $Q=\{X \in \Pi(G[\widehat{M}])$ : $X \cap M \neq \varnothing\}$. By Proposition 2.1.(1), $M \in \mathcal{M}(G[\widehat{M}])$. By definition of $\widehat{M},|Q| \geq 2$. Thus $M=\cup Q$ because $\Pi(G[\widehat{M}]) \subseteq \mathcal{S}(G[\widehat{M}])$. Furthermore $Q \neq \Pi(G[\widehat{M}])$ because $M \notin \mathcal{S}_{\geq 2}(G)$. By Proposition 2.2.(2), $Q \in \mathcal{M}(G[\widehat{M}] / \Pi(G[\widehat{M}]))$. As $2 \leq|Q|<|\Pi(G[\widehat{M}])|, \lambda_{G}(\widehat{M}) \in\{\bigcirc, \bigcirc\}$. If there is $X \in Q \cap \Pi_{\geq 2}(G[\widehat{M}])$, then $a \leftrightarrow_{H} X$ by what precedes and hence $a \longleftrightarrow_{H} M$. Assume that $Q \subseteq \Pi_{1}(G[\widehat{M}])$. We obtain that $M$ is a clique or a stable set in $G$. Since $\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2, M \in \mathbb{M}(G)$ and $a \not \leftrightarrow_{H} M$ by definition of $H$.

As $p(G)=2, H$ admits a nontrivial module $M_{H}$. We have $a \in M_{H}$ because $\mathcal{M}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$.

First, we show that $N \subseteq M_{H}$ for each $N \in \mathbb{P}(G)$. By Proposition 2.1.(1), $M_{H} \cap(N \cup\{a\}) \in \mathcal{M}(H[N \cup\{a\}])$. Since $H[N \cup\{a\}]$ is prime and $a \in$ $M_{H} \cap(N \cup\{a\})$, we obtain either $\left(M_{H} \backslash\{a\}\right) \cap N=\varnothing$ or $N \subseteq M_{H} \backslash\{a\}$. Suppose for a contradiction that $\left(M_{H} \backslash\{a\}\right) \cap N=\varnothing$. By Proposition 2.1.(1), $M_{H} \backslash\{a\} \in \mathcal{M}(G)$. There is $i \in\{0,1\}$ such that $\left(M_{H} \backslash\{a\}, N\right)_{G}=i$ by Proposition 2.1.(3). Therefore $(a, N)_{H}=i$ which contradicts the fact that $H[N \cup\{a\}]$ is prime. It follows that $N \subseteq M_{H}$. Thus

$$
\begin{equation*}
\bigcup \mathbb{P}(G) \subseteq M_{H} \tag{5.1}
\end{equation*}
$$

Second, we show that $N \cap M_{H} \neq \varnothing$ for each $N \in \mathbb{M}(G)$. Otherwise consider $N \in \mathbb{M}(G)$ such that $N \cap M_{H}=\varnothing$. There is $i \in\{0,1\}$ such that $\left(M_{H} \backslash\right.$ $\{a\}, N)_{G}=i$. Thus $(a, N)_{H}=i$ which contradicts $a \not \longleftrightarrow_{H} N$. Therefore

$$
\begin{equation*}
N \cap M_{H} \neq \varnothing \quad \text { for each } \quad N \in \mathbb{M}(G) \tag{5.2}
\end{equation*}
$$

Third, let $v \in I(G)$. By (5.2), $N_{0} \cap M_{H} \neq \varnothing$. Since $\left(v, N_{0} \cap M_{H}\right)_{G} \neq(v, a)_{H}$, $v \in M_{H}$. Hence

$$
\begin{equation*}
I(G) \subseteq M_{H} \tag{5.3}
\end{equation*}
$$

By (5.1) and (5.3),

$$
\begin{equation*}
V(G) \backslash M_{H} \subseteq \mathbb{M}(G) \tag{5.4}
\end{equation*}
$$

To conclude, consider $v \in V(H) \backslash M_{H}$. By (5.4), there is $N_{v} \in \mathbb{M}(G)$ such that $v \in N_{v}$. By interchanging $G$ and $\bar{G}$, assume that $N_{v}$ is a stable set in $G$. Since $v \longleftrightarrow_{H} M_{H}$ and $\left(v, N_{v} \cap M_{H}\right)_{G}=0$, we obtain $\left(v, M_{H}\right)_{H}=0$. Let $N \in \mathbb{M}(G) \backslash\left\{N_{v}\right\}$. By Corollary 4.7, $N \cap N_{v}=\varnothing$. As $N \cap M_{H} \neq \varnothing$ by (5.2), we have $\left(v, N \cap M_{H}\right)_{G}=0$ and hence $(v, N)_{G}=0$. It follows that $N_{G}(v)=\varnothing$. Therefore $\left(N_{v}, V(G) \backslash N_{v}\right)_{G}=0$ because $N_{v} \in \mathcal{M}(G)$. Since $N_{v}$ is a stable set in $G$, we obtain $N_{v} \subseteq\left\{u \in V(G): N_{G}(u)=\varnothing\right\}$. Clearly $\left\{u \in V(G): N_{G}(u)=\varnothing\right\} \in \mathcal{M}(G)$ and $\left\{u \in V(G): N_{G}(u)=\varnothing\right\}$ is a stable set in $G$. Thus $\iota(G) \leq \max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2$. Consequently $N_{v}=\left\{u \in V(G): N_{G}(u)=\varnothing\right\}$.

Proof of Theorem 1.6. Consider a graph $G$ such that

$$
\max \left(\alpha_{M}(G), \omega_{M}(G)\right)=2^{k}
$$

where $k \geq 1$. It follows from Corollary 1.5 that $p(G)=k$ or $k+1$.
To begin, assume that $\iota(G)=2^{k}$ or $\iota(\bar{G})=2^{k}$. By Lemma 4.6, $p(G) \geq k+1$ and hence $p(G)=k+1$.

Conversely, assume that $p(G)=k+1$. If $k=1$, then it suffices to apply Proposition 5.1. Assume that $k \geq 2$. For convenience set

$$
\mathbb{M}_{\max }(G)=\left\{N \in \mathbb{M}(G):|N|=\max \left(\alpha_{M}(G), \omega_{M}(G)\right)\right\}
$$

With each $N \in \mathbb{M}_{\max }(G)$ associate $w_{N} \in N$. Set $W=\left\{w_{N}: N \in \mathbb{M}_{\max }(G)\right\}$.
We prove that $\max \left(\alpha_{M}(G-W), \omega_{M}(G-W)\right)=2^{k}-1$. Let $N \in \mathbb{M}_{\text {max }}(G)$. By Corollary 4.7, the elements of $\mathbb{M}_{\max }(G)$ are pairwise disjoint. Thus $N \backslash W=N \backslash\left\{w_{N}\right\}$. Clearly $N \backslash\left\{w_{N}\right\}$ is a clique or a stable set in $G-W$. Furthermore $N \backslash\left\{w_{N}\right\} \in \mathcal{M}(G-W)$. Therefore $2^{k}-1=\left|N \backslash\left\{w_{N}\right\}\right| \leq$ $\max \left(\alpha_{M}(G-W), \omega_{M}(G-W)\right)$. Now consider $N^{\prime} \in \mathbb{M}_{\max }(G-W)$. We show that $N^{\prime} \in \mathcal{M}(G)$. We have to verify that for each $N \in \mathbb{M}_{\max }(G)$, $w_{N} \longleftrightarrow{ }_{G}$ $N^{\prime}$. Let $N \in \mathbb{M}_{\max }(G)$. First, asume that there is $v \in\left(N \backslash\left\{w_{N}\right\}\right) \backslash N^{\prime}$. We have $v \longleftrightarrow N_{G}$. As $N$ is a clique or a stable set in $G,\left\{v, w_{N}\right\} \in \mathcal{M}(G[N])$. By Proposition 2.1.(2), $\left\{v, w_{N}\right\} \in \mathcal{M}(G)$. Thus $w_{N} \longleftrightarrow_{G} N^{\prime}$. Second, assume that $N \backslash\left\{w_{N}\right\} \subseteq N^{\prime}$. Clearly $w_{N} \longleftrightarrow{ }_{G} N^{\prime}$ when $N \backslash\left\{w_{N}\right\}=N^{\prime}$. Assume that $N^{\prime} \backslash\left(N \backslash\left\{w_{N}\right\}\right) \neq \varnothing$. By interchanging $G$ and $\bar{G}$, assume that $N^{\prime}$ is a clique in $G-W$. As $N \backslash\left\{w_{N}\right\} \subseteq N^{\prime}$ and $\left|N \backslash\left\{w_{N}\right\}\right| \geq 2$, we obtain that $N$ is a clique in $G$. Since $\left(N \backslash\left\{w_{N}\right\}, N^{\prime} \backslash N\right)_{G}=1$ and since $N \in \mathcal{M}(G)$, we have $\left(w_{N}, N^{\prime} \backslash N\right)_{G}=1$. Furthermore $\left(w_{N}, N \backslash\left\{w_{N}\right\}\right)_{G}=1$ because $N$ is a clique in $G$. Therefore $\left(w_{N}, N^{\prime}\right)_{G}=1$. Consequently $N^{\prime} \in$ $\mathcal{M}(G)$. As $N^{\prime}$ is a clique in $G$, there is $M \in \mathbb{M}(G)$ such that $M \supseteq N^{\prime}$. If $M \notin \mathbb{M}_{\max }(G)$, then $\left|N^{\prime}\right| \leq|M|<\max \left(\alpha_{M}(G), \omega_{M}(G)\right)$. If $M \in \mathbb{M}_{\max }(G)$, then $N^{\prime} \subseteq M \backslash\left\{w_{M}\right\}$ and hence $\left|N^{\prime}\right|<|M|=\max \left(\alpha_{M}(G), \omega_{M}(G)\right)$. In both cases, we have $\left|N^{\prime}\right|=\max \left(\alpha_{M}(G-W), \omega_{M}(G-W)\right)<\max \left(\alpha_{M}(G), \omega_{M}(G)\right)$. It follows that $\max \left(\alpha_{M}(G-W), \omega_{M}(G-W)\right)=2^{k}-1$.

By Corollary 1.5, $p(G-W)=k$ and hence there exists a prime $k$-extension $H^{\prime}$ of $G-W$. We extend $H^{\prime}$ to $V\left(H^{\prime}\right) \cup W$ as follows. Let $N \in \mathbb{M}_{\max }(G)$. Consider the function $f_{N}: N \backslash\left\{w_{N}\right\} \longrightarrow 2^{V\left(H^{\prime}\right) \backslash V(G-W)}$ defined by $v \mapsto$ $N_{H^{\prime}}(v) \backslash V(G-W)$ for $v \in N \backslash\left\{w_{N}\right\}$. Since $H^{\prime}$ is prime, $f_{N}$ is injective. As $\left|N \backslash\left\{w_{N}\right\}\right|=2^{k}-1$ and $\left|2^{V\left(H^{\prime}\right) \backslash V(G-W)}\right|=2^{k}$, there is a unique $X_{N} \subseteq$ $V\left(H^{\prime}\right) \backslash V(G-W)$ such that $f_{N}(v) \neq X_{N}$ for every $v \in N \backslash\left\{w_{N}\right\}$. Let $H$ be the extension of $H^{\prime}$ to $V\left(H^{\prime}\right) \cup W$ such that $N_{H}\left(w_{N}\right) \cap\left(V\left(H^{\prime}\right) \backslash V(G-W)\right)=$ $X_{N}$ for each $N \in \mathbb{M}_{\max }(G)$. As $p(G)=k+1, H$ is not prime. Consider a nontrivial module $M_{H}$ of $H$.

Observe the following. Given $N \neq N^{\prime} \in \mathbb{M}_{\max }(G)$,

$$
\left.\begin{array}{r}
N \cap M_{H} \neq \varnothing  \tag{5.5}\\
\text { and } \\
N^{\prime} \cap M_{H} \neq \varnothing
\end{array}\right\} \Longrightarrow M_{H} \supseteq V\left(H^{\prime}\right) .
$$

Indeed, by Proposition 2.1.(1), $M_{H} \cap V(G) \in \mathcal{M}(G)$. Since $\widehat{N}, \widehat{N^{\prime}} \in \mathcal{S}(G)$ and since $\left(M_{H} \cap V(G)\right) \cap \widehat{N} \neq \varnothing$ and $\left(M_{H} \cap V(G)\right) \cap \widehat{N^{\prime}} \neq \varnothing, M_{H} \cap V(G)$ is comparable to $\widehat{N}$ and $\widehat{N^{\prime}}$ under inclusion. Suppose for a contradiction that $M_{H} \cap V(G) \mp \widehat{N}$ and $M_{H} \cap V(G) \mp \widehat{N^{\prime}}$. It follows that $N^{\prime} \cap \widehat{N} \neq \varnothing$ and $N \cap \widehat{N^{\prime}} \neq \varnothing$. As $\widehat{N^{\prime}} \in \mathcal{S}(G), \widehat{N^{\prime}} \ddagger N$ or $N \subseteq \widehat{N^{\prime}}$. In the first instance, it follows from Proposition 2.3 that $\widehat{N^{\prime}}$ would be a nontrivial strong module of $G[N]$ which contradicts the fact that $N$ is a clique or a stable set in $G$. Thus $N \subseteq \widehat{N^{\prime}}$ and hence $\widehat{N} \subseteq \widehat{N^{\prime}}$. Similarly $N^{\prime} \subseteq \widehat{N}$ and $\widehat{N^{\prime}} \subseteq \widehat{N}$. Therefore $\widehat{N}=\widehat{N^{\prime}}$ and it would follow from Proposition 4.5 that $N=N^{\prime}$. Consequently $\widehat{N} \subseteq\left(M_{H} \cap V(G)\right)$ or $\widehat{N^{\prime}} \subseteq\left(M_{H} \cap V(G)\right)$. For instance, assume that $\widehat{N} \subseteq$ $\left(M_{H} \cap V(G)\right)$. By Proposition 2.1.(1), $M_{H} \cap V\left(H^{\prime}\right) \in \mathcal{M}\left(H^{\prime}\right)$. Furthermore $\left(M_{H} \cap V\left(H^{\prime}\right)\right) \supseteq(N \backslash W)$ and $N \backslash W=N \backslash\left\{w_{N}\right\}$ by Corollary 4.7. Since $H^{\prime}$ is prime, we have $V\left(H^{\prime}\right) \subseteq M_{H}$. It follows that (5.5) holds.

As $H^{\prime}$ is prime and $M_{H} \cap V\left(H^{\prime}\right) \in \mathcal{M}\left(H^{\prime}\right)$, we have either $\left|M_{H} \cap V\left(H^{\prime}\right)\right| \leq 1$ or $M_{H} \supseteq V\left(H^{\prime}\right)$. For a contradiction, suppose that $\left|M_{H} \cap V\left(H^{\prime}\right)\right| \leq 1$. There is $N \in \mathbb{M}_{\max }(G)$ such that $w_{N} \in M_{H}$. It follows from (5.5) that $M_{H} \cap W=\left\{w_{N}\right\}$. Thus there is $v \in V\left(H^{\prime}\right)$ such that $M_{H} \cap V\left(H^{\prime}\right)=\{v\}$. Clearly $M_{H}=\left\{v, w_{N}\right\}$ and we distinguish the following two cases to obtain a contradiction.

- Suppose that $v \in V(G-W)$. By Proposition 2.1.(1), $\left\{v, w_{N}\right\} \in$ $\mathcal{M}(G)$. Therefore there is $N^{\prime} \in \mathbb{M}_{\max }(G)$ such that $N^{\prime} \supseteq\left\{v, w_{N}\right\}$. By Corollary 4.7, $N=N^{\prime}$ and we would obtain $N_{H}\left(w_{N}\right) \cap\left(V\left(H^{\prime}\right)\right.$ \ $V(G-W))=f_{N}(v)$.
- Suppose that $v \in V\left(H^{\prime}\right) \backslash V(G-W)$. There is $i \in\{0,1\}$ such that $\left(w_{N}, N \backslash\left\{w_{N}\right\}\right)_{G}=i$. We obtain $\left(v, N \backslash\left\{w_{N}\right\}\right)_{H^{\prime}}=i$ because $\left\{v, w_{N}\right\} \in \mathcal{M}(H)$. Since $f_{N}$ is injective, the function $g_{N}$ : $N \backslash\left\{w_{N}\right\} \longrightarrow 2^{\left(\left(V\left(H^{\prime}\right) \backslash V(G-W)\right) \backslash\{v\}\right)}$, defined by $g_{N}(u)=f_{N}(u) \backslash\{v\}$ for $u \in N \backslash\left\{w_{N}\right\}$, is injective as well. We would obtain $2^{k}-1 \leq 2^{k-1}$.

Consequently $V\left(H^{\prime}\right) \subseteq M_{H}$. As $M_{H}$ is a nontrivial module of $H$, there exists $N \in \mathbb{M}_{\max }(G)$ such that $w_{N} \notin M$. By interchanging $G$ and $\bar{G}$, assume that $N$ is a stable set in $G$. We have $\left(w_{N}, N \backslash\left\{w_{N}\right\}\right)_{G}=0$ and hence $\left(w_{N}, V\left(H^{\prime}\right)\right)_{H}=0$. In particular $\left(w_{N}, V(G-W)\right)_{G}=0$. Given $N^{\prime} \in \mathbb{M}_{\max }(G) \backslash\{N\}$, we obtain $\left(w_{N}, N^{\prime} \backslash\left\{w_{N^{\prime}}\right\}\right)_{G}=0$. Since $N^{\prime} \in \mathcal{M}(G)$, $\left(w_{N}, w_{N^{\prime}}\right)_{G}=0$. It follows that $N_{G}\left(w_{N}\right)=\varnothing$. As at the end of the proof of Proposition 5.1, we conclude by $N=\left\{u \in V(G): N_{G}(u)=\varnothing\right\}$.

Lastly, we examine the non prime graphs $G$ such that

$$
\alpha_{M}(G)=\omega_{M}(G)=1 .
$$

Proposition 5.2. For every non prime graph $G$ such that $|V(G)| \geq 4$ and $\alpha_{M}(G)=\omega_{M}(G)=1$, we have $p(G)=1$.

Proof. Consider a minimal element $N_{\min }$ of $\mathcal{S}_{\geq 2}(G)$. By Proposition 2.3, $\Pi\left(G\left[N_{\min }\right]\right) \subseteq \mathcal{S}(G)$. By minimality of $N_{\min }, \Pi\left(G\left[N_{\min }\right]\right)=\Pi_{1}\left(G\left[N_{\min }\right]\right)$. Thus $G\left[N_{\min }\right]$ and $G\left[N_{\min }\right] / \Pi\left(G\left[N_{\min }\right]\right)$ are isomorphic by Proposition 2.2.(1). If $\lambda_{G}\left(N_{\min }\right) \in\{\bigcirc, \bullet\}$, then $N_{\text {min }}$ is a clique or a stable set in $G$ and there would be $N \in \mathbb{M}(G)$ such that $N \supseteq N_{\min }$. Therefore $\lambda_{G}\left(N_{\text {min }}\right)=\sqsubset$ and $N_{\text {min }} \in \mathbb{P}(G)$.

Let $a \notin V(G)$. For each $N \in \mathbb{P}(G), G[N]$ is prime. By Lemma 3.3, $G[N]$ admits a prime 1-extension $H_{N}$ to $N \cup\{a\}$. We consider the 1-extension $H$ of $G$ to $V(G) \cup\{a\}$ satisfying the following.
(1) For each $N \in \mathbb{P}(G), H[N \cup\{a\}]=H_{N}$.
(2) Let $v \in I(G)$. There is $i \in\{0,1\}$ such that $\left(v, N_{\min }\right)_{G}=i$. We require that $(v, a)_{H} \neq i$.
We proceed as in the proof of Proposition 5.1, to show that $\mathcal{M}_{\geq 2}(G) \cap$ $\mathcal{M}(H)=\varnothing$. To begin, we prove that $\mathcal{S}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$. Given $M \in$ $\mathcal{S}_{\geq 2}(G)$, we have to verify that $a \not \leftrightarrow_{H} M$. Let $N$ be a minimal element under inclusion of $\left\{N^{\prime} \in \mathcal{S}_{\geq 2}(G): N^{\prime} \subseteq M\right\}$. We obtain that $\Pi(G[N])=\Pi_{1}(G[N])$ so that $G[N]$ and $G[N] / \Pi(G[N])$ are isomorphic by Proposition 2.2.(1). If $\lambda_{G}(N) \in\{\bigcirc, \bigcirc\}$, then $N$ is a clique or a stable set in $G$ and there would be $N^{\prime} \in \mathbb{M}(G)$ such that $N^{\prime} \supseteq N$. Thus $\lambda_{G}(N)=\sqsubset$. We obtain that $G[N]$ is prime, that is, $N \in \mathbb{P}(G)$. Since $H[N \cup\{a\}]$ is prime, $a \not \leftrightarrow_{H} N$ and hence $a \nVdash_{H} M$.

Now we prove that $\mathcal{M}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$. Let $M \in \mathcal{M}_{\geq 2}(G)$. Since $\mathcal{S}_{\geq 2}(G) \cap \mathcal{M}(H)=\varnothing$, assume that $M \notin \mathcal{S}_{\geq 2}(G)$. Set $Q=\{X \in \Pi(G[\widehat{M}]):$ $X \cap M \neq \varnothing\}$. We obtain that $M=\cup Q,|Q| \geq 2$ and $\lambda_{G}(\widehat{M}) \in\{\bigcirc, \bigcirc\}$. If $\left|\Pi_{1}(G[\widehat{M}])\right| \geq 2$, then we would have $\{v \in \widehat{M}:\{v\} \in \Pi(G[\widehat{M}])\} \in \mathbb{M}(G)$ by Proposition 4.5. Consequently $\left|\Pi_{1}(G[\widehat{M}])\right| \leq 1$ and there is $X \in Q \cap$ $\Pi_{\geq 2}(G[\widehat{M}])$. By what precedes $a \not \leftrightarrow_{H} X$ and hence $a \not \leftrightarrow_{H} M$.

Lastly, we establish that $H$ is prime. Let $M_{H} \in \mathcal{M}_{\geq 2}(H)$. As previously shown, $a \in M_{H}$. We show that $N \subseteq M_{H}$ for each $N \in \mathbb{P}(G)$. By Proposition 2.1.(1), $M_{H} \cap(N \cup\{a\}) \in \mathcal{M}(H[N \cup\{a\}])$. Since $H[N \cup\{a\}]$ is prime and $a \in M_{H} \cap(N \cup\{a\})$, we obtain either $\left(M_{H} \backslash\{a\}\right) \cap N=\varnothing$
or $N \subseteq M_{H} \backslash\{a\}$. Suppose for a contradiction that $\left(M_{H} \backslash\{a\}\right) \cap N=\varnothing$. By Proposition 2.1.(1), $M_{H} \backslash\{a\} \in \mathcal{M}(G)$. There is $i \in\{0,1\}$ such that $\left(M_{H} \backslash\{a\}, N\right)_{G}=i$ by Proposition 2.1.(3). Therefore $(a, N)_{H}=i$ which contradicts the fact that $H[N \cup\{a\}]$ is prime. It follows that $N \subseteq M_{H}$ for each $N \in \mathbb{P}(G)$. In particular $N_{\min } \subseteq M_{H}$. Let $v \in I(G)$. As $\left(v, N_{\min }\right)_{G} \neq(v, a)_{H}$, $v \in M_{H}$. Consequently $M_{H}=V(H)$.
